## Drilling Tips for High Speed Steel Cobalt Drill Bits:

- When drilling deep holes (3 or more drill bit diameters deep) use lubricants (NOT WATER) to dissipate heat from the tip. Always use a lubricant while drilling Aluminum.

- Drill a short distance and then back the drill bit out of the hole before progressing. This will help remove loosened chips from the flute and introduce more lubricant into the hole.

- Recommended Cutting Speeds: 2,500 RPM for Smaller Bits up to 1/8" and 600 RPM for Larger Bits up to 1/2" - Use a sliding scale to decrease the speed for larger drill bits. Faster speeds can be used when drilling wood, composites, plastics, etc.
